

PROJECT REPORT

Bakery sales prediction

Matthias Faust Ngoc Linh Nguyen Thorsten Köhler

VARIABLES by group

Weather Categories Rolling Mean Temperature Peak Temperature **HOLIDAY RESIDUAL** Public holidays School holidays Oddities Kieler Woche festival **ECONOMY TIME** GDP Weekend CPI Day of the week Unemployment rate Month of the year

WEATHER

Weather features

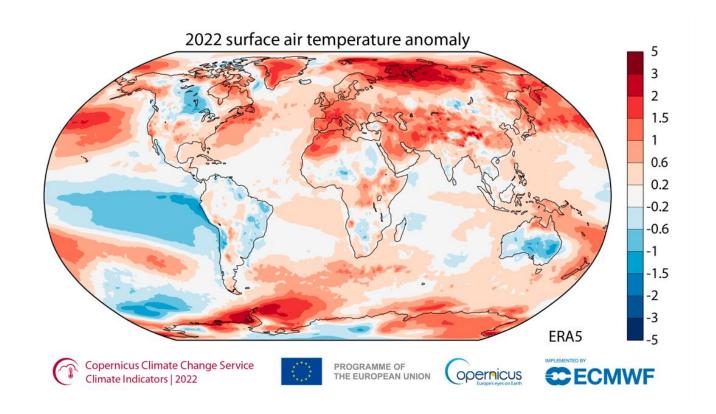

Varname	Original variable	Description
Weather_category	Wettercode (Weather code)	Rain, After rain, Showers & Thunderstorms, Snow & Ice, Fog, Others
Temperature_class	Temperatur (Temperature)	Cold, Cool, Mild, Warm, Unknown
Cloud_class	Bewoelkung (Cloud cover)	Sunny, Cloudy, Unknown
Wind_class	Windgeschwindigkeit (Wind speed)	Breeze, Wind, Storm, Unknown
Temperatur		Temperature
Rolling_temp_mean		Mean temperature of the last 5 Days
Temperature above/below mean		Significant difference to the rolling temp mean

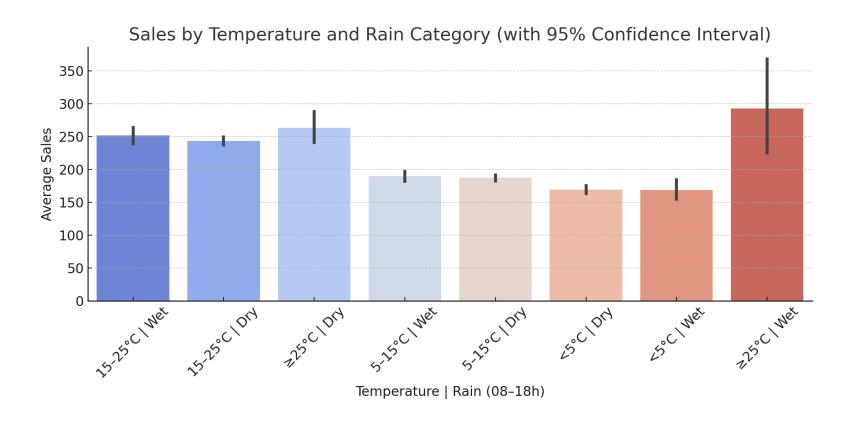

MISSING VALUE IMPUTATION

ERA5 Reanalysis Data

- Simulation of the past weather, prompted by measurements
- Data openly available from 1940 to present
- Hourly time resolution

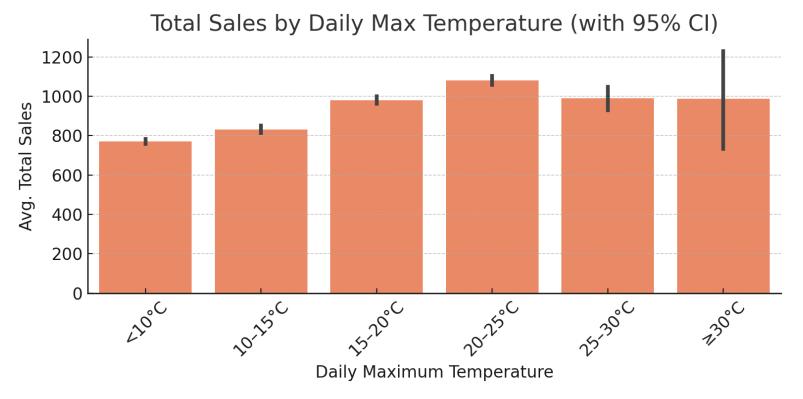

Weather Variables

Combination of rain and high temperature increases sales

Weather Variables

Sales increase with temperature but decrease if the maximum temperature is above 25°C

Unemployment rate

Higher unemployment rate is associated with slightly higher average total sales

NEURAL NETWORK

NEURAL NETWORK

Loss function: Huber Learning rate: 0.001

Epochs: 150 Batch size: 32

MAPE

- Training Data: 16.23%
- Validation Data: 17.99%
 - o *Bread: 18.97%*
 - o Roll: 11.98%
 - o Croissant: 18.77%
 - o Confectionery: 25.82%
 - o Cake: 14.44%
 - Seasonal Bread: -- % (not in the validation period)

HIGHLIGHTS

Worst fails:

- Working with Git codespaces and Tensorflow
- The quite often seemingly esoteric effects of Feature Engineering and Model Optimization

Best improvement:

- Encoding date and weather features
- Talking things through as a team very important to get a better understanding

Thank You
